PRODUCT RELEASE

Latest Technology for Biological Waste Treatment

Bionetix International - Presents its New Improved Product Lines!

Bionetix International a wholly owned subsidiary of Cortec® Corporation, in the business of manufacturing microbial based bio-products, headquartered in Montreal, Canada is happy to present it's four new enhanced products lines. Bionetix is comprised of solid, proprietary technologies to produce biological waste treatment products that are used in thousands of applications and various industries worldwide.

The main purpose of Bionetix products is to promote healthy environment by providing superior, safe alternatives to current treatment methods. The expertise of our employees permits us to offer our clients timely technical support to develop tailor-made solutions for special applications.

Our products enable degrading target substances in waste systems by using completely natural methods and develop environmentally safe manufacturing and disposal processes.

Capability of microorganisms to transform pollutants and synthetic chemicals into sources of energy and raw materials for their own growth, proves that expensive chemicals can be replaced with biological processes that are lower in cost, more efficient and perfectly safe for our surroundings!

Our integrated resources will provide our customers with unique benefits of remediation through bioaugmentation and biostimulation. Bacteria used in the Bionetix line of products degrade more complex chemicals along with higher volumes of waste materials.

Bionetix now offers an improved portfolio of products for treatment applications in the industry, municipalities, agriculture and animal feed. Our products are used all over the world under widely differing environmental, climatic, physical and social treatment conditions.

a) Agricultural Treatments - Grow higher quality crops...have greener fairways and reduce impacts on land and dependency on chemicals and reduce input costs.

b) Industrial Waste Treatment - Treatment of wastewater on site prior to discharge to sewage. Bacteria specifically selected to degrade target substances in waste water systems, like fats and oils, food, beverage and alcohol. Treat industrial sludge to meet stringent discharge standards. Accelerate composting, reduce sludge, and treat manure. Also improves odor control.

c) Municipal Waste Treatment - Enhances waste treatment in municipal wastewater. Reduces organic acids, ammonia and toxic substances, and controls odor. Increases treatment efficiency while reducing plant upsets from shock.

d) Animal Feed - In an era when there are increasing safety concerns over the use of antibiotics and mounting consumer pressure about chemical residues appearing in fish, meat and milk, more natural alternative strategies are sought by livestock producers to improve animal health and productivity. Direct Fed Microbials (DFMs) have a positive effect on overall animal health, welfare and performance. Includes both probiotics and prebiotics.
